

Bob Campana AI Reel Project – Workflow

Project Objective

Create a 60-second AI-generated vertical reel based on the Bob Campana story while maintaining character consistency, cinematic storytelling, and a repeatable production workflow.

Workflow Used

1. Story Breakdown

The story was analyzed and divided into 7 key scenes:

1. The Mountain to Climb
2. The Important Phone Call
3. River Islands Construction Site
4. Meeting the Billionaire
5. Restaurant Relocation
6. Helicopter Pitch
7. Legacy Ending

2. Character Consistency

A reference image of Bob Campana was used to maintain consistent facial features, age, hairstyle, and appearance across all generated scenes.

3. AI Image Generation

Cinematic animated-film-style images were created for each scene using detailed prompts focused on storytelling, environment, lighting, and mood.

4. AI Video Generation

Each image was converted into a short video clip using Google Flow. Camera movement, cinematic motion, and scene-specific animation prompts were used to create engaging visual storytelling.

5. Video Editing

All generated video clips were imported into a mobile video editor and arranged in chronological order. Scene titles, transitions, and background music were added to improve viewer engagement.

Tools Used

- ChatGPT (Prompt Creation and Scene Planning)
- AI Image Generation Tools
- Google Flow (Image-to-Video Generation)
- Mobile Video Editor (Final Assembly)

Key Learnings

- Scene-by-scene generation improves consistency.
- Using a character reference image helps maintain visual continuity.
- Short AI-generated clips provide more control than generating a full video at once.
- Combining image generation, video generation, and editing creates a scalable content workflow.

Final Reel Export

This workflow can be automated to produce high-quality author-focused social media reels at scale.

Outcome

A complete AI-generated vertical reel was created using cinematic visuals, character consistency, AI video generation, and mobile editing tools. The workflow is repeatable and suitable for future automation.
